

Same frozen P50: effective slider contact, motor response and grip stability

Full success: .2/.2 N authored amplitudes

Failure: .5/.5 N authored amplitudes

Two fixed actual36s recovery episodes, not a reliability estimate. Contacts/physical state are evaluation-only. Joint lag is not pressure; authored slider force is not real total resistance. Signed potential forces can assist on descent. Applied torque includes original gravity compensation and clipping. No policy/controller changes or added physics runs.
